◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

We discuss the formalization, in the Matita Theorem Prover, of a few, basic results on Turing Machines, up to the existence of a (certified) Universal Machine.

The work is a first step towards the creation of a formal repository in Complexity Theory, and a piece of a long term work of logical revisitation of the foundations of Complexity.

▲□ > ▲ □ > ▲ □ > ▲ □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □ > ● < □

Provide evidence that formalizing and checking (elements of) Computablity/Complexity Theory is an effort that

- can be done
- is worth to be done
- will eventually be done

# (Too) many variants

- deterministic/ non deterministic
- number of tapes/pushdowns stores
- alphabet
- on-line/off-line (strong on-line)
- memory models: tape/pushdown/stack (oblivious tapes)

#### Ming Li [11]

It is essential to understand the precise relationship among those computing models, e.g., with or without nondeterminism and/or some more tapes (or pushdown stores).

◆ロ → ◆母 → ◆ 母 → ◆ 母 → ◆ 句 へ ⊙

Upper bounds:

- ▶ 1 tape simulation of k tapes in  $O(t^2)$  (Hartmanis & Stearns [10])
- 2 tape simulation of k tapes in O(tlogt) (Hennie & Stearns [20])

Lower bounds:

- 2 tapes are better than 1 (Rabin [15])
- ▶ k tapes are better than k 1 (Aanderaa [1], Paul, Seiferas & Simon [14])
- simulating k tapes by k − 1 takes Ω(nlog<sup>1/k</sup>n) time for strong on-line machines (Paul [13])
- simulating one queue or two pushdown stores by one tape takes Ω(n<sup>1.618</sup>) time (Vitanyi [22])

▶ ...

About Matita

Motivations

**Turing Machines** 

**Composing Machines** 

The Universal Machine

Size and cost of the development

A complexity problem

(本語) (本語) (本語)

We shall work with single tape Turing Machines.

◆□ > ◆□ > ◆臣 > ◆臣 > 善臣 • のへで

```
\begin{array}{ll} \textbf{record TM (sig:FinSet): Type :=} \\ \{ \mbox{ states }: \mbox{ FinSet}; \\ \mbox{ trans }: \mbox{ states } \times \mbox{ (option sig)} \rightarrow \\ & \mbox{ states } \times \mbox{ (option (sig \times move))}; \\ \mbox{ statt }: \mbox{ states }; \\ \mbox{ halt }: \mbox{ states } \rightarrow \mbox{ bool} \}. \end{array}
```

Since *trans* works on finite sets, its graph is a finite set too, and we have library functions to pass between the two representations.

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● ○ ○ ○

#### Computations

```
record config (sig, states : FinSet): Type :=
  {cstate : states ; ctape : tape sig }.
definition step :=\lambdasig.\lambdaM:TM sig.\lambdac:config sig (states sig M).
  let current_char :=current ? (ctape ?? c) in
  let \langle news, mv \rangle :=trans sig M \langle cstate ?? c, current_char \rangle in
  mk_config ?? news (tape_move sig (ctape ?? c) mv).
let rec loop (A:Type) n (f:A\rightarrowA) p a on n :=
  match n with
  [ 0 \Rightarrow None ?
  | S m \Rightarrow if p a then (Some ? a) else loop A m f p (f a) ].
definition loopM :=\lambdasig,M,i,inc.
  loop ? i (step sig M) (\lambdac.halt sig M (cstate ?? c)) inc.
```

◆ロ → ◆母 → ◆ 目 → ◆ 目 → ● へ ⊙

#### Semantics

We express semantics in terms of relations between tapes (not configurations!) realized by the machine:

```
\begin{array}{ll} \mbox{definition} & \mbox{initc} := \lambda sig. \lambda M: TM sig. \lambda t. \\ mk\_config sig (states sig M) (start sig M) t. \\ \mbox{definition} & \mbox{Realize} := \lambda sig. \lambda M: TM sig. \lambda R: relation (tape sig ). \\ \forall t. \exists i. \exists outc. \\ loopM sig M i (initc sig M t) = Some ? outc \land R t (ctape ?? outc). \end{array}
```

**notation**:  $M \models R$ 

**Remark** We work with tapes for compositionality reasons: Turing machine may work with a common notion tape but have different internal states.

◆ロ → ◆母 → ◆ 母 → ◆ 母 → ◆ 句 へ ⊙

Realizability implies termination; we may define a weaker notion

 $\begin{array}{l} \mbox{definition} & \mbox{WRealize} := \lambda sig. \lambda M: TM \ sig. \lambda R: relation \ (tape \ sig \ ). \\ \forall t, i, outc. \\ & \mbox{loopM} \ sig \ M \ i \ (initc \ sig \ M \ t) = Some \ ? \ outc \ \rightarrow R \ t \ (ctape \ ?? \ outc). \end{array}$ 

**notation**:  $M \models R$ 

Weak realizability + termination implies realizablity.

22

・ロマ・白マ・山マ・山マ・白マ

Conditional realizability:

**notation**:  $M \models_q [Rtrue, Rfalse]$

write c write the character c on the tape at the current head position

move\_r move the head one step to the right

move\_l move the head one step to the left

test\_char f perform a boolean test f on the current character and enter state tc\_true or tc\_false according to the result of the test

swap\_r swap the current character with its right neighbour

swap\_l swap the current character with its left neighbour

About Matita

Motivations

**Turing Machines** 

**Composing Machines** 

The Universal Machine

Size and cost of the development

A complexity problem

A normal Turing machine is an ordinary machine where:

- 1. the tape alphabet is  $\{0,1\};$
- 2. the finite states are supposed to be an initial interval of the natural numbers.

By convention, we assume the starting state is 0.

```
\begin{array}{ll} \textbf{record} \ normalTM : Type := \\ \{ \ no\_states \ : \ nat; \\ \ pos\_no\_states \ : \ (0 < no\_states); \\ ntrans : \ (initN \ no\_states) \times Option \ bool \\ & \rightarrow (initN \ no\_states) \times Option \ (bool \times Move); \\ nhalt \ : \ initN \ no\_states \ \rightarrow bool \}. \end{array}
```

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ● ○ ○ ○

- Every TM can be transformed into a Normal Machine with a linear slow-down
- The Universal Machine simulates Normal Machines but is not itself a Normal Machine; it works on a richer alphabet comprising a few separators; moreover, each character can be "marked" with a boolean, for copying purposes.

◆□▶ ◆□▶ ◆目▶ ◆目▶ ●目 - のへで

The efficient way to simulate a machine with a single tape is to keep the program (as well as the current state) close to the head. The tape has the following structure (q is a string of booleans!)

 $\alpha \# \langle \mathbf{q}, \mathbf{c} \rangle \# \mathbf{tuples} \# \beta$ 

where  $\alpha c\beta$  is (morally) the tape of the emulated machine. An emulation step consists in

- search among the tuples one matching (q, c);
- update the state-character pair
- execute the tape move

|▲□ ▶ ▲ 臣 ▶ ▲ 臣 ▶ ● 臣 ● りへで

# Library functions

We need a good library of functions for copying and comparing strings. Both rely on the use of (pairs of) marks to identify source and target positions:

mark mark the current cell

clear\_mark clear the mark (if any) from the current cell

 $adv\_mark\_r$  shift the mark one position to the right

adv\_mark\_l shift the mark one position to the left

adv\_both\_marks shift the marks at the right and left of the head one position to the right

match\_and\_advance f if the current character satisfies the boolean test f then advance both marks and otherwise remove them

adv\_to\_mark\_r move the head to the next mark on the right adv\_to\_mark\_l move the head to the next mark on the left

Every relation over tapes can be reflected into a corresponding relation on the low-level tape used by the Universal Machine.

**theorem** sem\_universal2:  $\forall$ M:normalTM.  $\forall$ R. M  $\models$  R  $\rightarrow$  universalTM  $\models$  (low\_R M (start ? M) R).

Moreover, if M terminate, then the simulation terminates too.

**theorem** terminate\_UTM:  $\forall$ M:normalTM. $\forall$ t. M  $\downarrow$  t  $\rightarrow$  universalTM  $\downarrow$  (low\_config M (mk\_config ?? (start ? M) t)).

Proofs are long but not particularly complex.

## The cost of interpreting

Let us say that an interpeter is fair [3] if it simulates a program preserving (the order of) its complexity.

Is the previous interpreter fair?

Not so clear: booleans on the simulated tape are part of larger alphabet, and require a richer encoding. Sticking to a boolean alphabet, this means that each boolean must be "padded" into a small string of booleans.

This transformation may require a quadratic time on a single tape machine:

Is it possible to define a notion of pairing on single tape turing machines (in a categorical sense), in such a way that the diagonal function has linear complexity?

In general, is there a truly finitistic computational model admitting a *fair* interpreter?
