

Semantic Web

Andrea Giovanni Nuzzolese

10/11/2016 - Bologna

What do you know about the Web? and Internet?

- Basic protocols
 - MAC, PPP, DSL, ... (link layer, physical networks)
 - TCP, UDP, ... (transport layer)
 - IPv4, IPv6, ... (internet layer)
 - HTTP (GET, POST, ...), SSH, FTP, DNS, POP, IMAP, SMTP, ... (application layer)
- Identification scheme
 - URI (Uniform Resource Identifier)
 - URL (Uniform Resource Locator)
 - PURL (Persistent URL)
 - URN (Uniform Resource Name) e.g. ISBN, ISSN, DOI (Digital Object Identifier)
 - IRI (International Resource Identifier)
 - Okkam ENS (Entity Name System, <http://api.okkam.org/>)
- Languages
 - HTML, CSS
 - XML, XSD
 - PHP
 - Javascript
- Architectures
 - Client-Server, LAMP, WISA
- Request-Response Loop / Peer-to-Peer models
- A lot of hardware (copper, fibres, computers, routers, switches, air conditioning, farms, data centers, ...)
- ...

Internet protocol suite

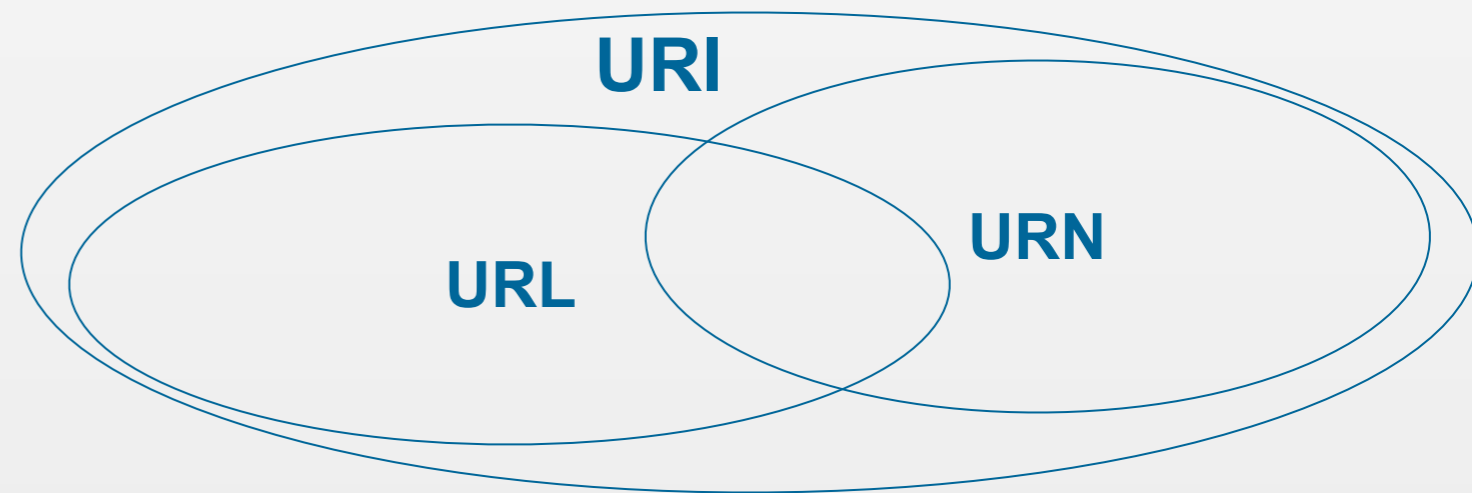

Application layer
 BGP · DHCP · **DNS** · FTP · HTTP · IMAP ·
 LDAP · MGCP · NNTP · NTP · POP ·
 ONC/RPC · RTP · RTSP · RIP · SIP · SMTP ·
 SNMP · SSH · Telnet · TLS/SSL · XMPP ·
more...

Transport layer
 TCP · UDP · DCCP · SCTP · RSVP · *more...*

Internet layer
 IP (IPv4 · IPv6) · ICMP · ICMPv6 · ECN ·
 IGMP · IPsec · *more...*

Link layer
 ARP · NDP · OSPF · Tunnels (L2TP) · PPP ·
 MAC (Ethernet · DSL · ISDN · FDDI) · *more...*

V · T · E

URL/URI/IRI

URL

identify what exists on the web.

<http://my-site.fr>

URI

identify, on the web, what exists.

<http://animals.org/zebra#this>

IRI

identify, on the web, in any language, what exists.

<http://الحيوانات.tn/斑馬#this>

Invented the web in 1989
(yeah!)

Invented the web in 1989
(yeah!)

Invented the semantic
web in 1994 (duh?)

**“To a computer, then, the web is a flat,
boring world devoid of meaning”**

Tim Berners Lee, <http://www.w3.org/Talks/WWW94Tim/>

“This is a pity, as in fact documents on the web describe real objects and imaginary concepts, and give particular relationships between them”

Tim Berners Lee, <http://www.w3.org/Talks/WWW94Tim/>

“Adding semantics to the web involves two things: allowing documents which have information in machine-readable forms, and allowing links to be created with relationship values.”

Tim Berners Lee, <http://www.w3.org/Talks/WWW94Tim/>

“The Semantic Web is not a separate Web but an **extension** of the current one, in which information is given well-defined meaning, better enabling **computers and people to work in cooperation.**”

Tim Berners Lee, <http://www.w3.org/Talks/WWW94Tim/>

The Web

- A principle: hypertext
- A protocol: HTTP
- An identification scheme: URNs/URIs
- A language: HTML

The Semantic Web

- A principle: hypertext
- A protocol: HTTP
- An identification scheme: URNs/URIs
- Languages: HTML, RDF, OWL, SPARQL

The Semantic Web

- Is an extension of the Web through standards by the World Wide Web Consortium (W3C)
- The Semantic Web provides a common framework that allows data to be shared and reused across application, enterprise, and community boundaries

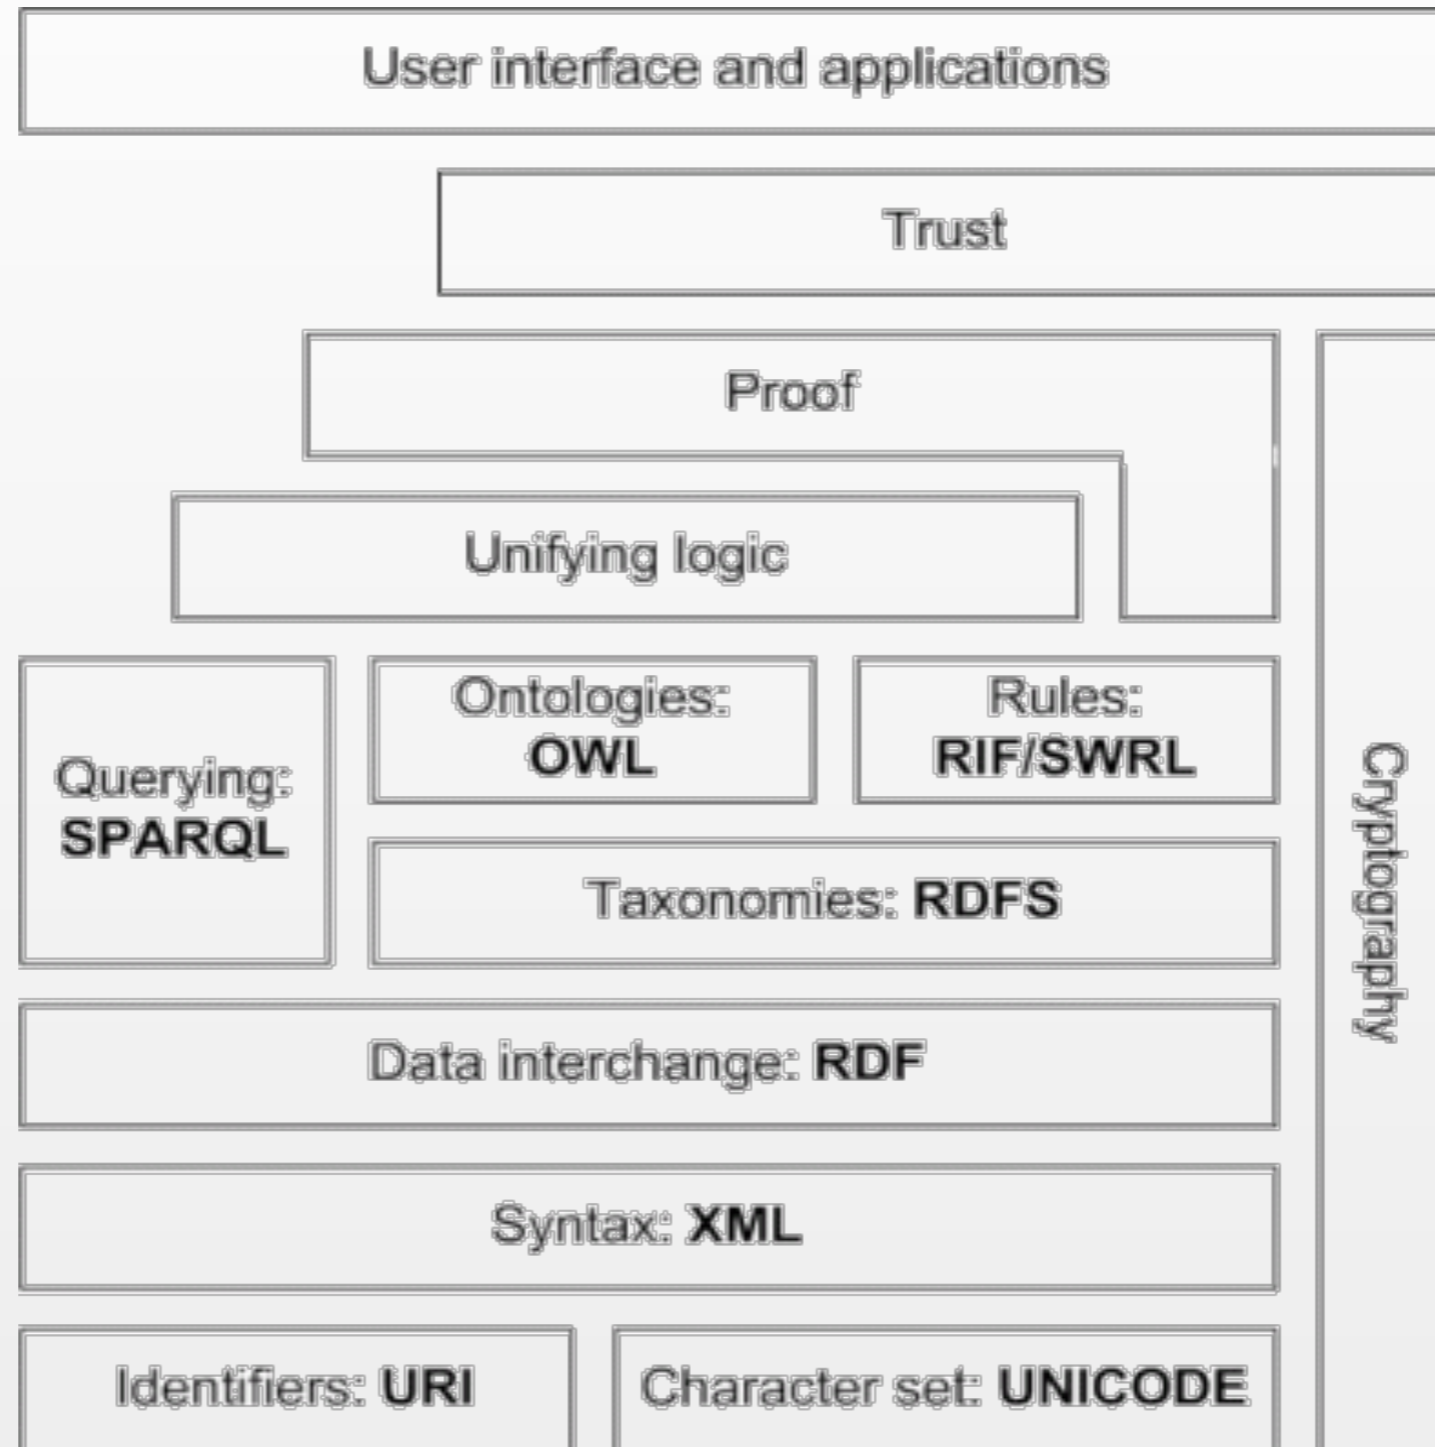

Who is using the Semantic Web?

The W3C “Layer Cake”

URIs and the Web of Things

- URIs (Unique Resource Identifiers) are used to identify things (also called entities) in the real world
- For instance: people, places, events, companies, products, movies, etc.

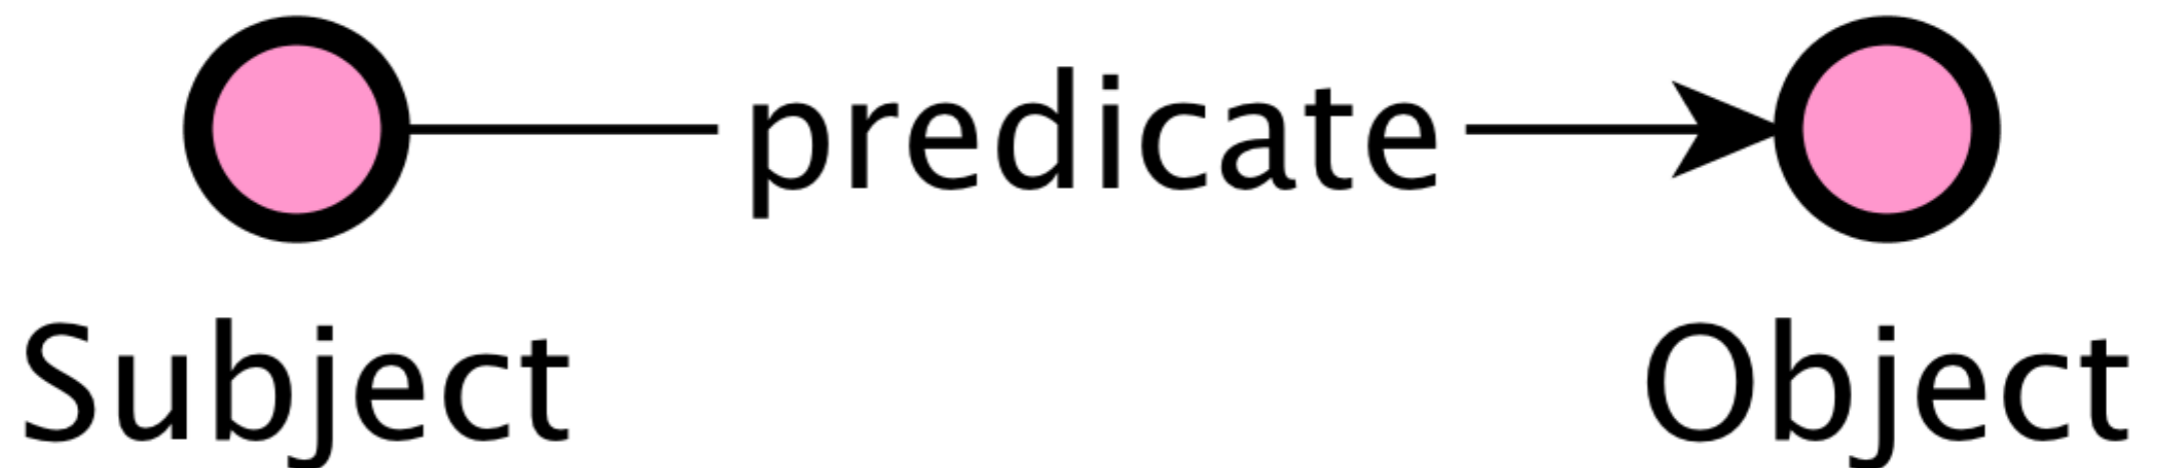

The RDF model

*Abstract
data representation*

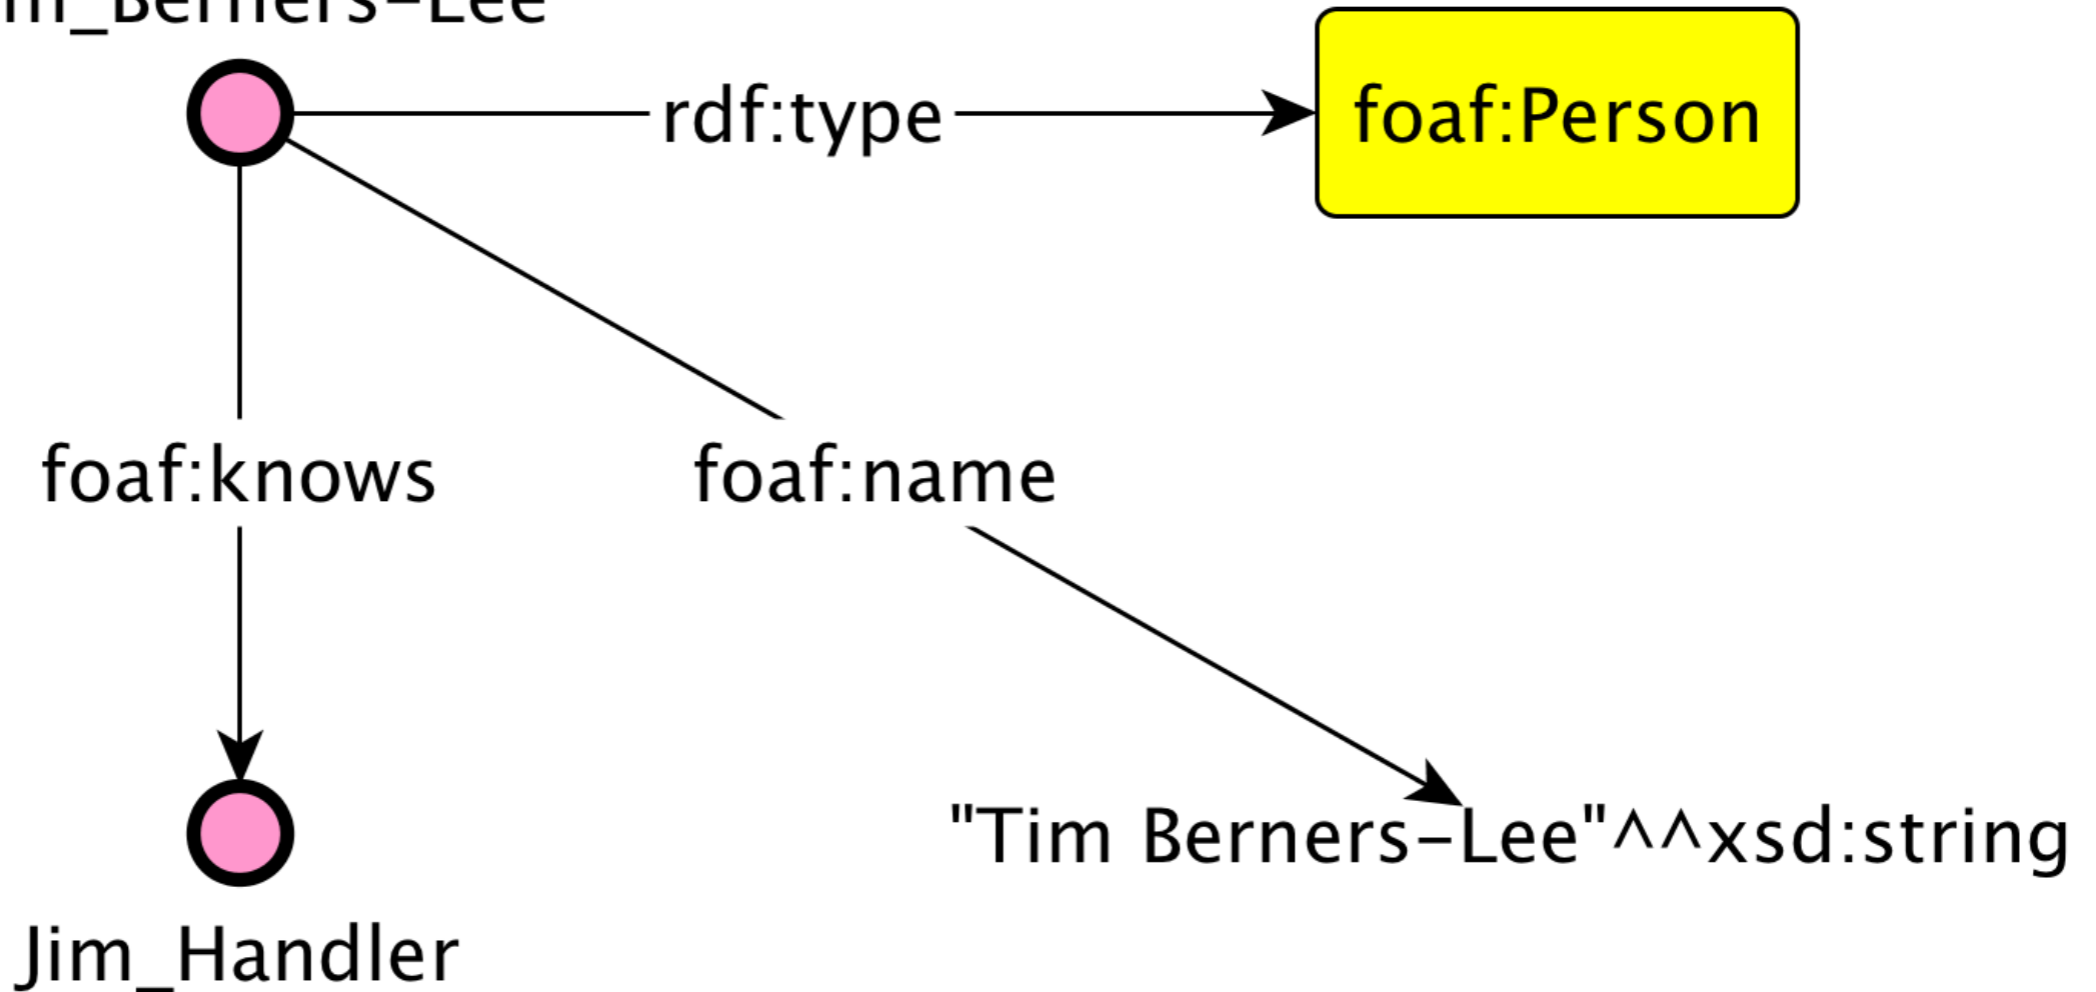

RDF is used to describe relationships between objects, identified by their URIs

RDF Example

Tim_Berners-Lee

: <http://www.foo.org/person/>

rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>

foaf: <http://xmlns.com/foaf/0.1/>

RDF serialization

As XML:

*Formal language
for data representation*

```
<?xml version="1.0"?>
<rdf:RDF xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
  xmlns:contact="http://www.w3.org/2000/10/swap/pim/contact#">
  <contact:Person rdf:about="http://www.w3.org/People/EM/contact#me">
    <contact:fullName>Eric Miller</contact:fullName>
    <contact:mailbox rdf:resource="mailto:em@w3.org"/>
    <contact:personalTitle>Dr.</contact:personalTitle>
  </contact:Person>
</rdf:RDF>
```

Others, ex: N3:

```
<http://www.example.com/alice/posts/trouble_with_bob>
  <http://purl.org/dc/elements/1.1/title> "The Trouble with Bob";
  <http://purl.org/dc/elements/1.1/creator> "Alice" .
```

SPARQL Sample

Query language to RDF

```
prefix db:      <http://dbpedia.org/resource/>
prefix dbo:     <http://dbpedia.org/ontology/>
prefix foaf:    <http://xmlns.com/foaf/0.1/>

select distinct ?name, ?website, ?abstract where {
  ?software a          dbo:Software .
  ?software dbo:license  db:LGPL .
  ?software dbo:genre    db:Enterprise_Content_Management .
  ?software foaf:name    ?name .
  ?software foaf:homepage ?website .
  ?software dbo:abstract ?abstract .
  FILTER ( lang(?abstract) = "en" ) .
}
```

OWL example

If:

```
:Novel          rdf:type owl:Class.  
:Short_Story   rdf:type owl:Class.  
:Poetry        rdf:type owl:Class.  
:Literature    rdf:type owl:Class;  
               owl:unionOf (:Novel :Short_Story :Poetry).  
  
<myWork> rdf:type :Novel .
```

*Formal language
for automated reasoning*

then the following holds, too:

```
<myWork> rdf:type :Literature .
```

Historical perspective

- From web 1.0: web of sites and pages, aka the World Wide Web
- To web 2.0: web of people and of participation, aka the Social Web (Blogs, RSS, tags, Facebook, Wikipedia, etc.)
- To web 3.0: web of data, of meaning and connected knowledge, aka the Semantic Web

Web Evolution

Web 3.0

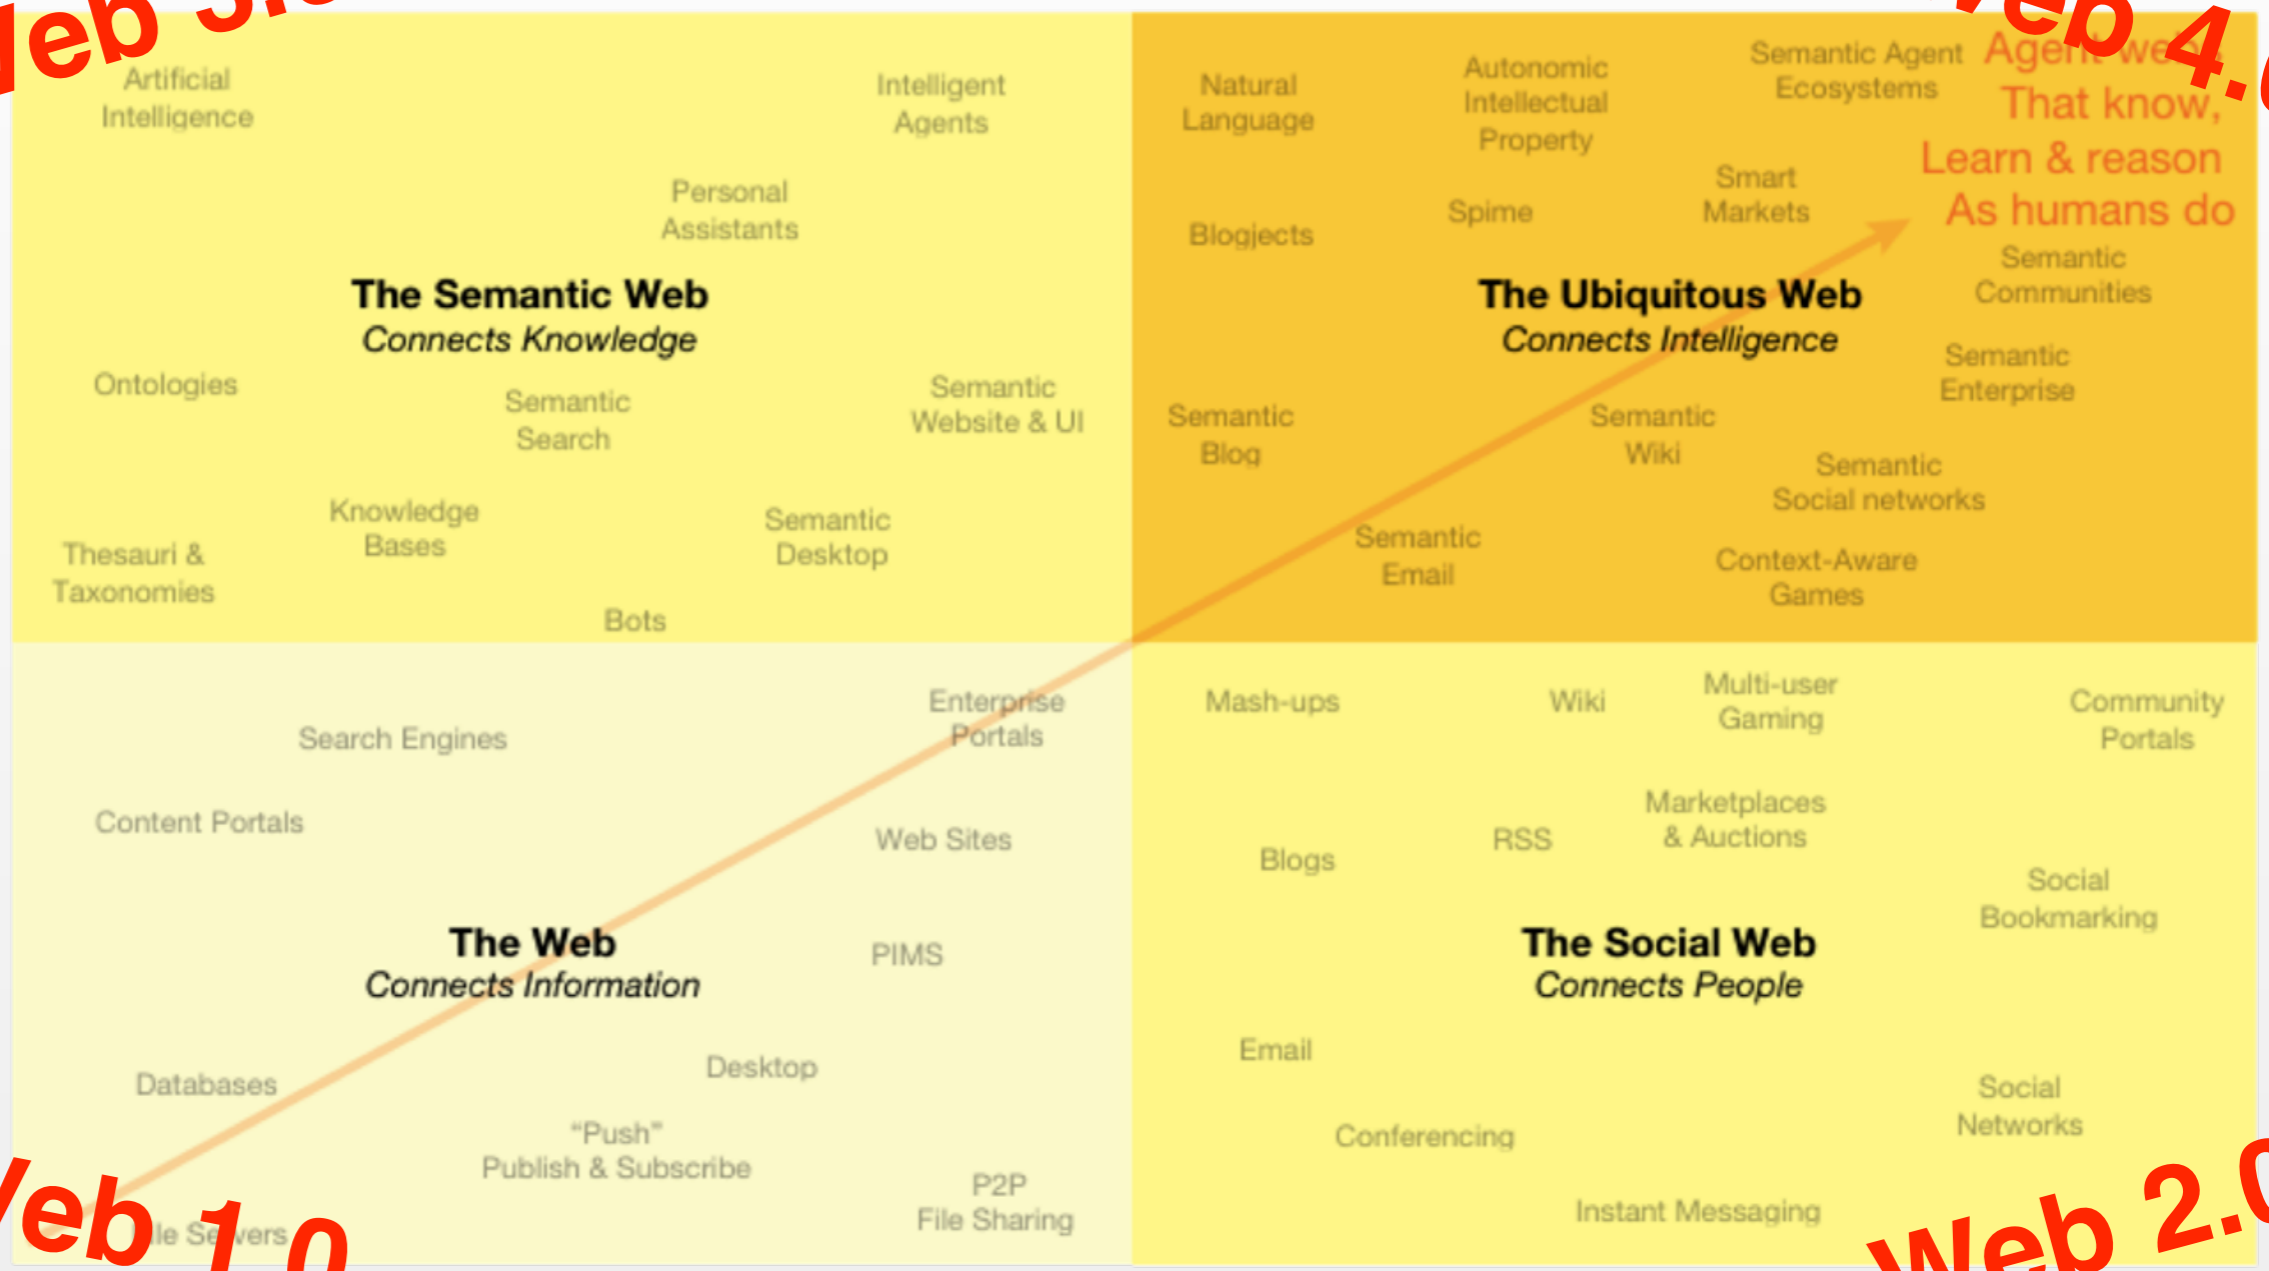

Web 4.0

Increasing Knowledge Connectivity & Reasoning

Increasing Social Connectivity

Web 1.0

Web 2.0

Where and how
to find, access and use
semantic web data and
schemas?

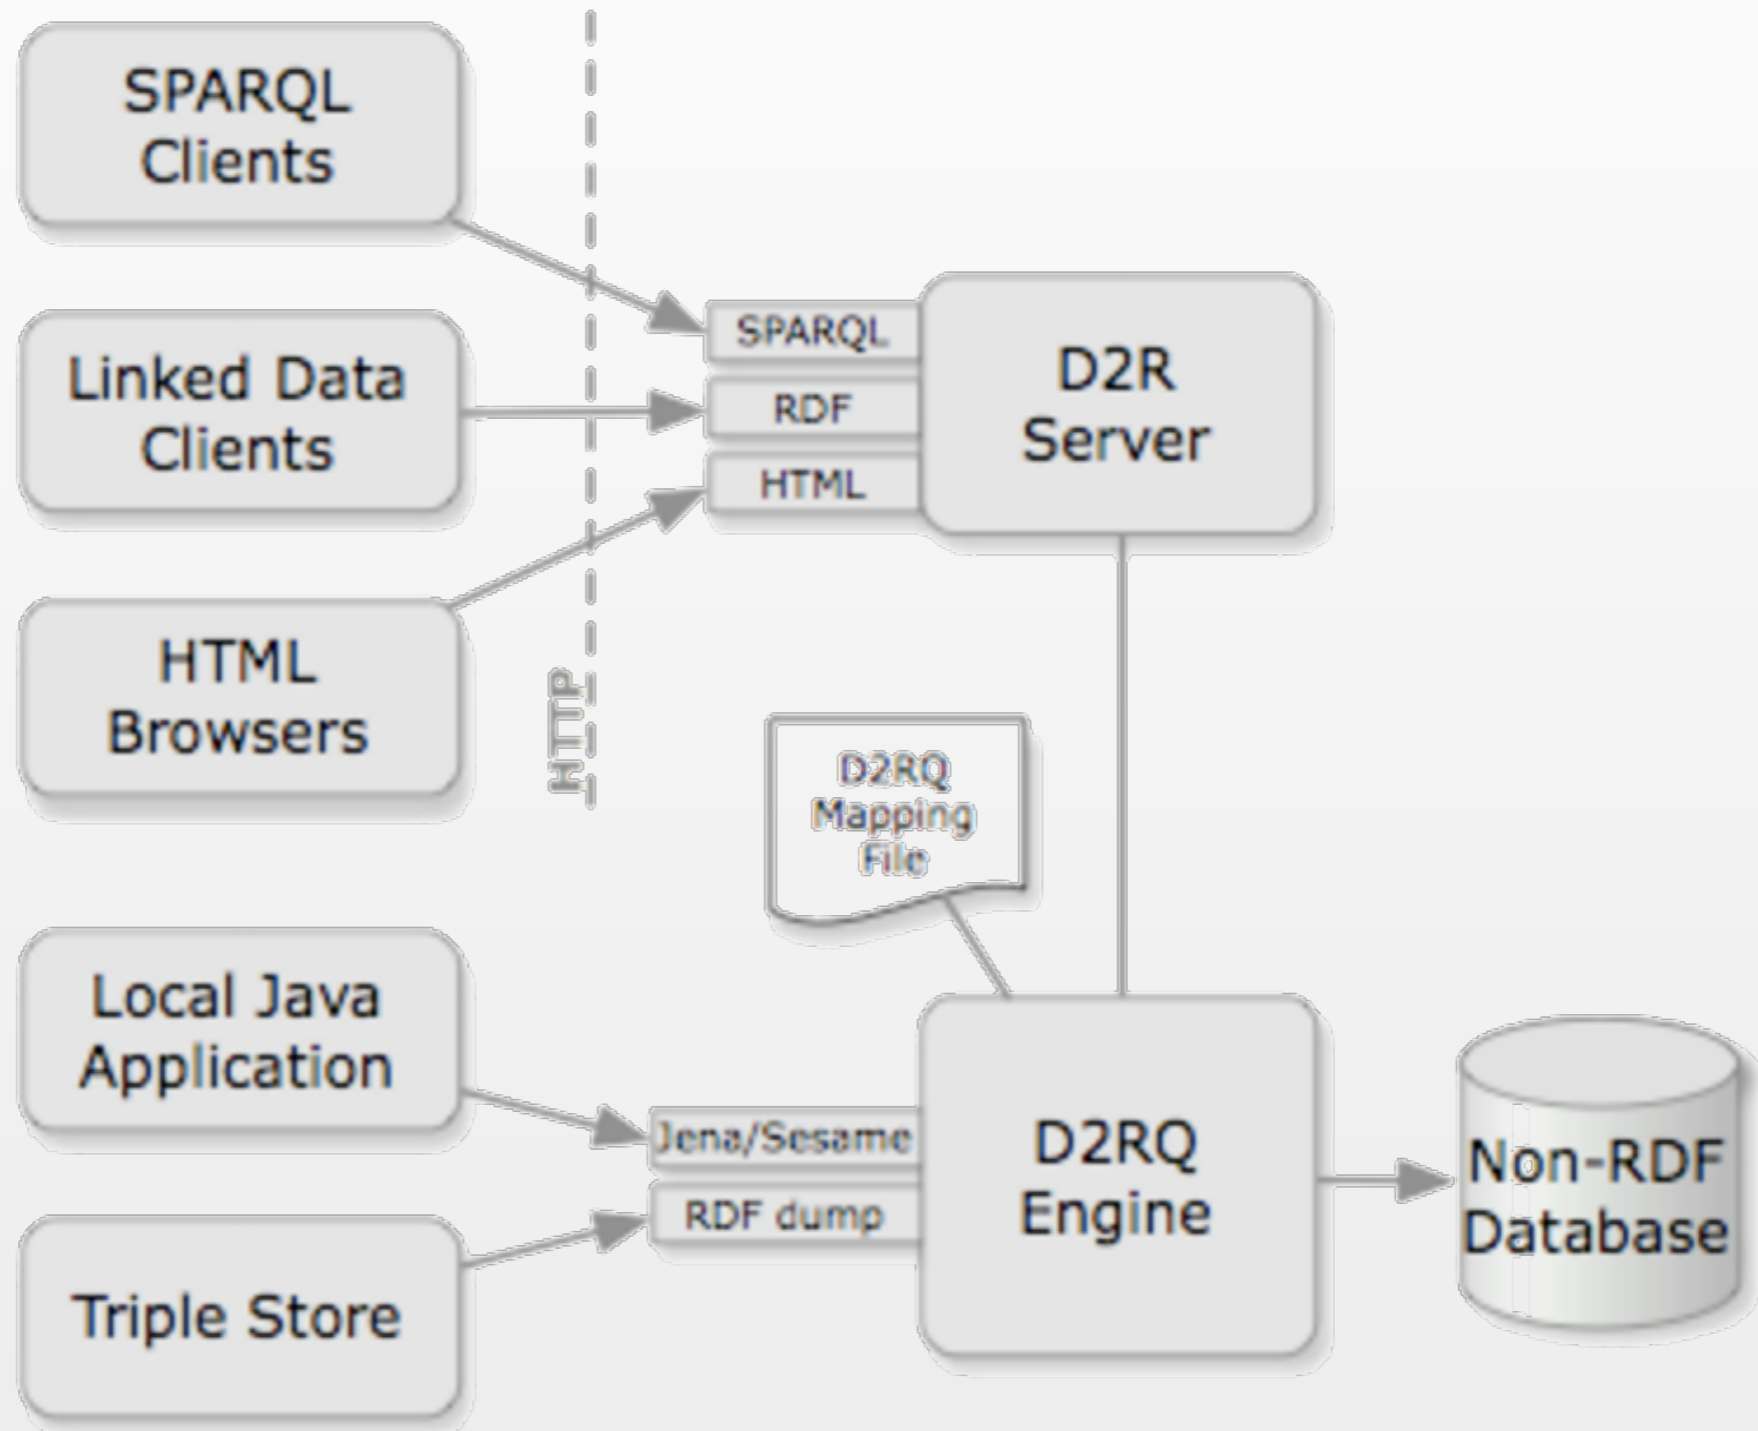

- Accessing non-RDF sources (e.g., relational databases) with SPARQL and as Linked Data
- Recipes based on mapping configurations to import data from relational databases
 - the mapping specify ho to interpret non-RDF data as RDF
- Example: D2R Server
 - a tool for publishing the content of relational databases on the Semantic Web, a global information space consisting of Linked Data.

D2R Server Architecture

Knowledge Extraction

- HTML scraping and natural language processing (NLP) techniques to extract semantic information from existing content / sites
- Generic solutions: OpenCalais, Zemanta, Apache Stanbol, NERD, FOX, FRED
- Pro: no need to change existing content
- Con: error prone, needs human checks

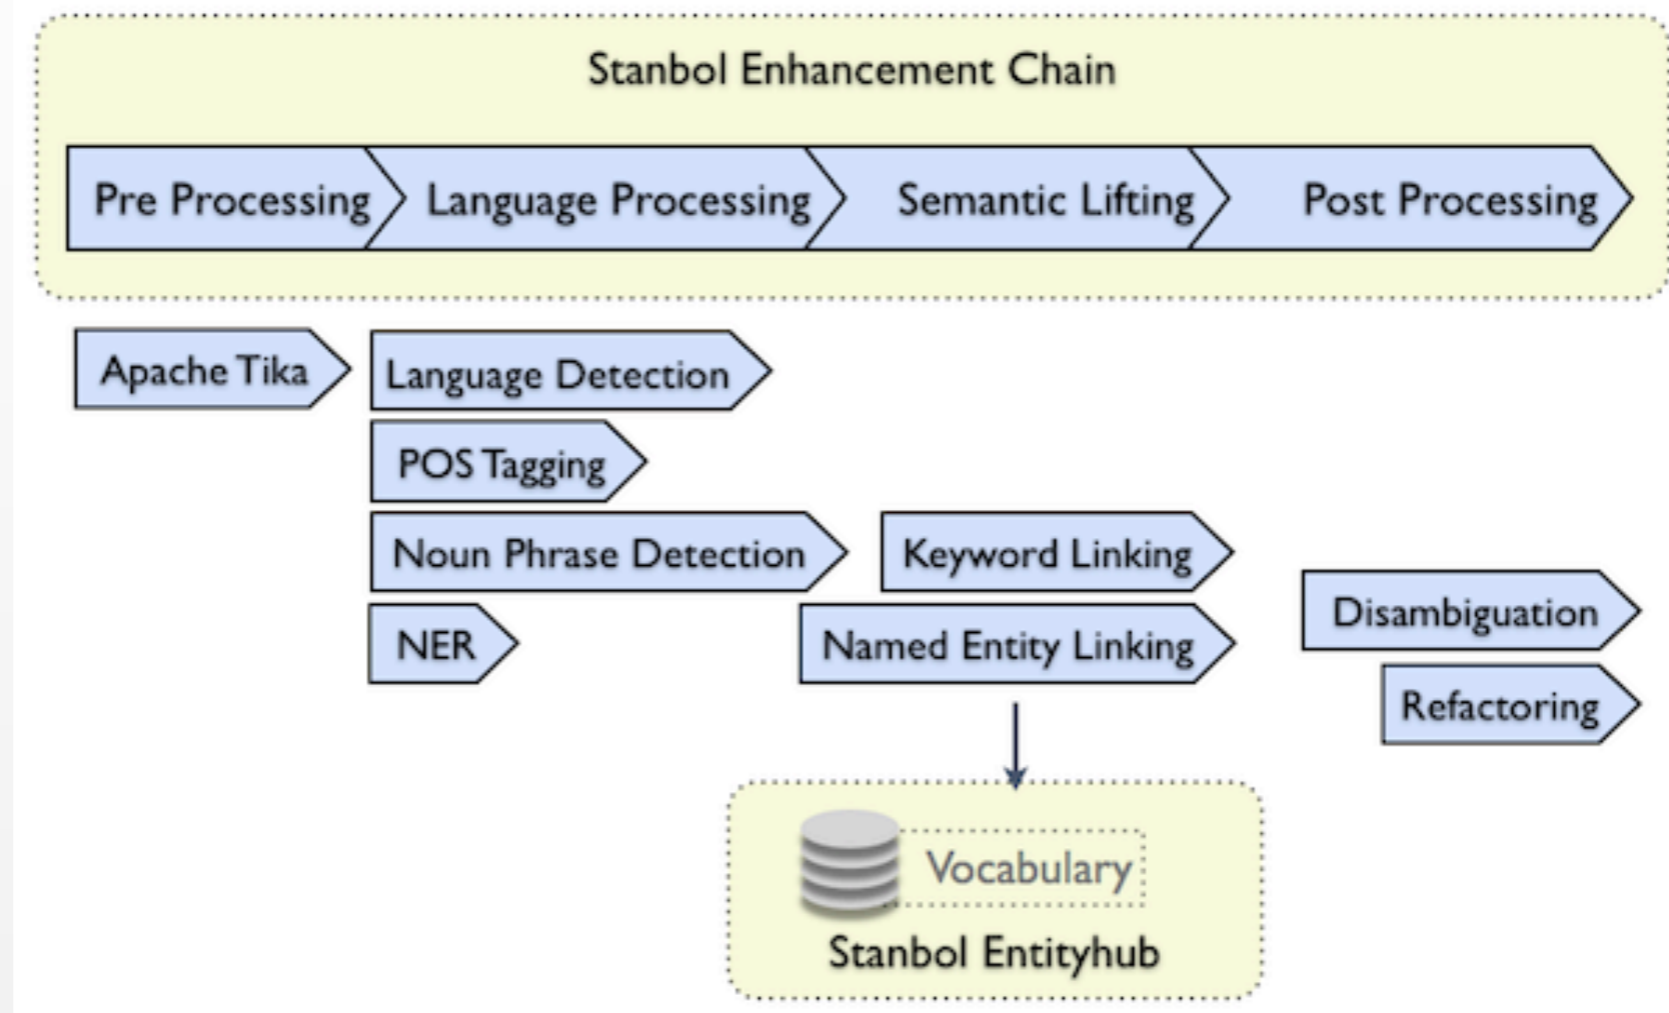

Apache Stanbol

- Apache Stanbol provides a set of reusable components for semantic content management.
- Apache Stanbol's intended use is to extend traditional content management systems with semantic services.
 - e.g., semantic enhancement of natural language text, named entity extraction and linking

Apache Stanbol enhancement chain

Miles Davis was an american jazz musician.
↓
dbpedia:Miles_Davis dbpedia:Musician
↓
dbpedia:American_jazz

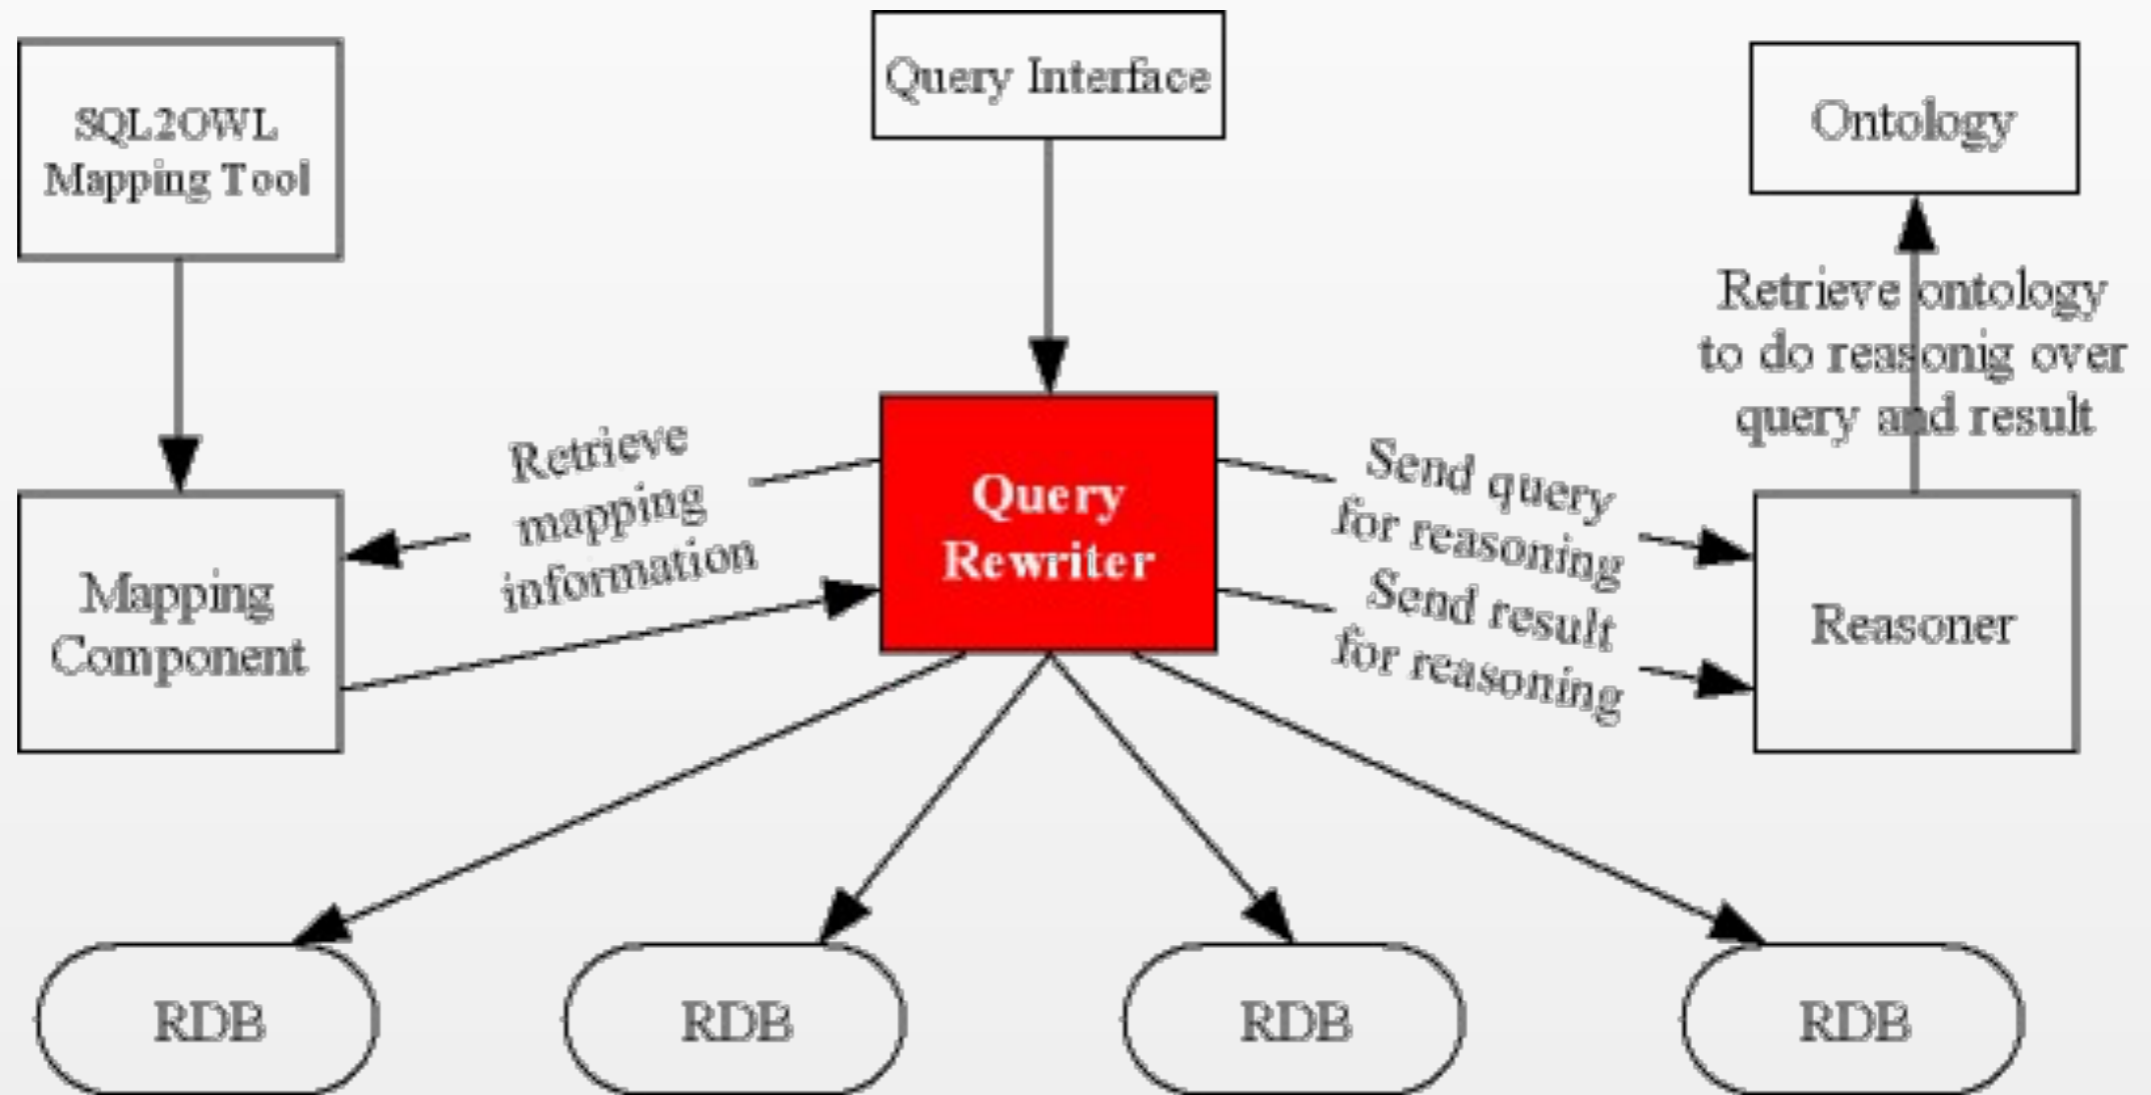

Reasoning

- Infer new knowledge from asserted one
- Based on logic axioms defined in a ontology modelled as OWL
- Reasoning can be used for query expansion in RDF knowledge bases

Reasoner based architecture

KB reuse

- Linked Open Data: (usually large) data repositories available on the web (for free or not), expressed using the RDF model
- Interoperability between these repositories (how to align their ontologies and entity names?) is usually partial

LOD Cloud

2010

LOD Cloud

2011

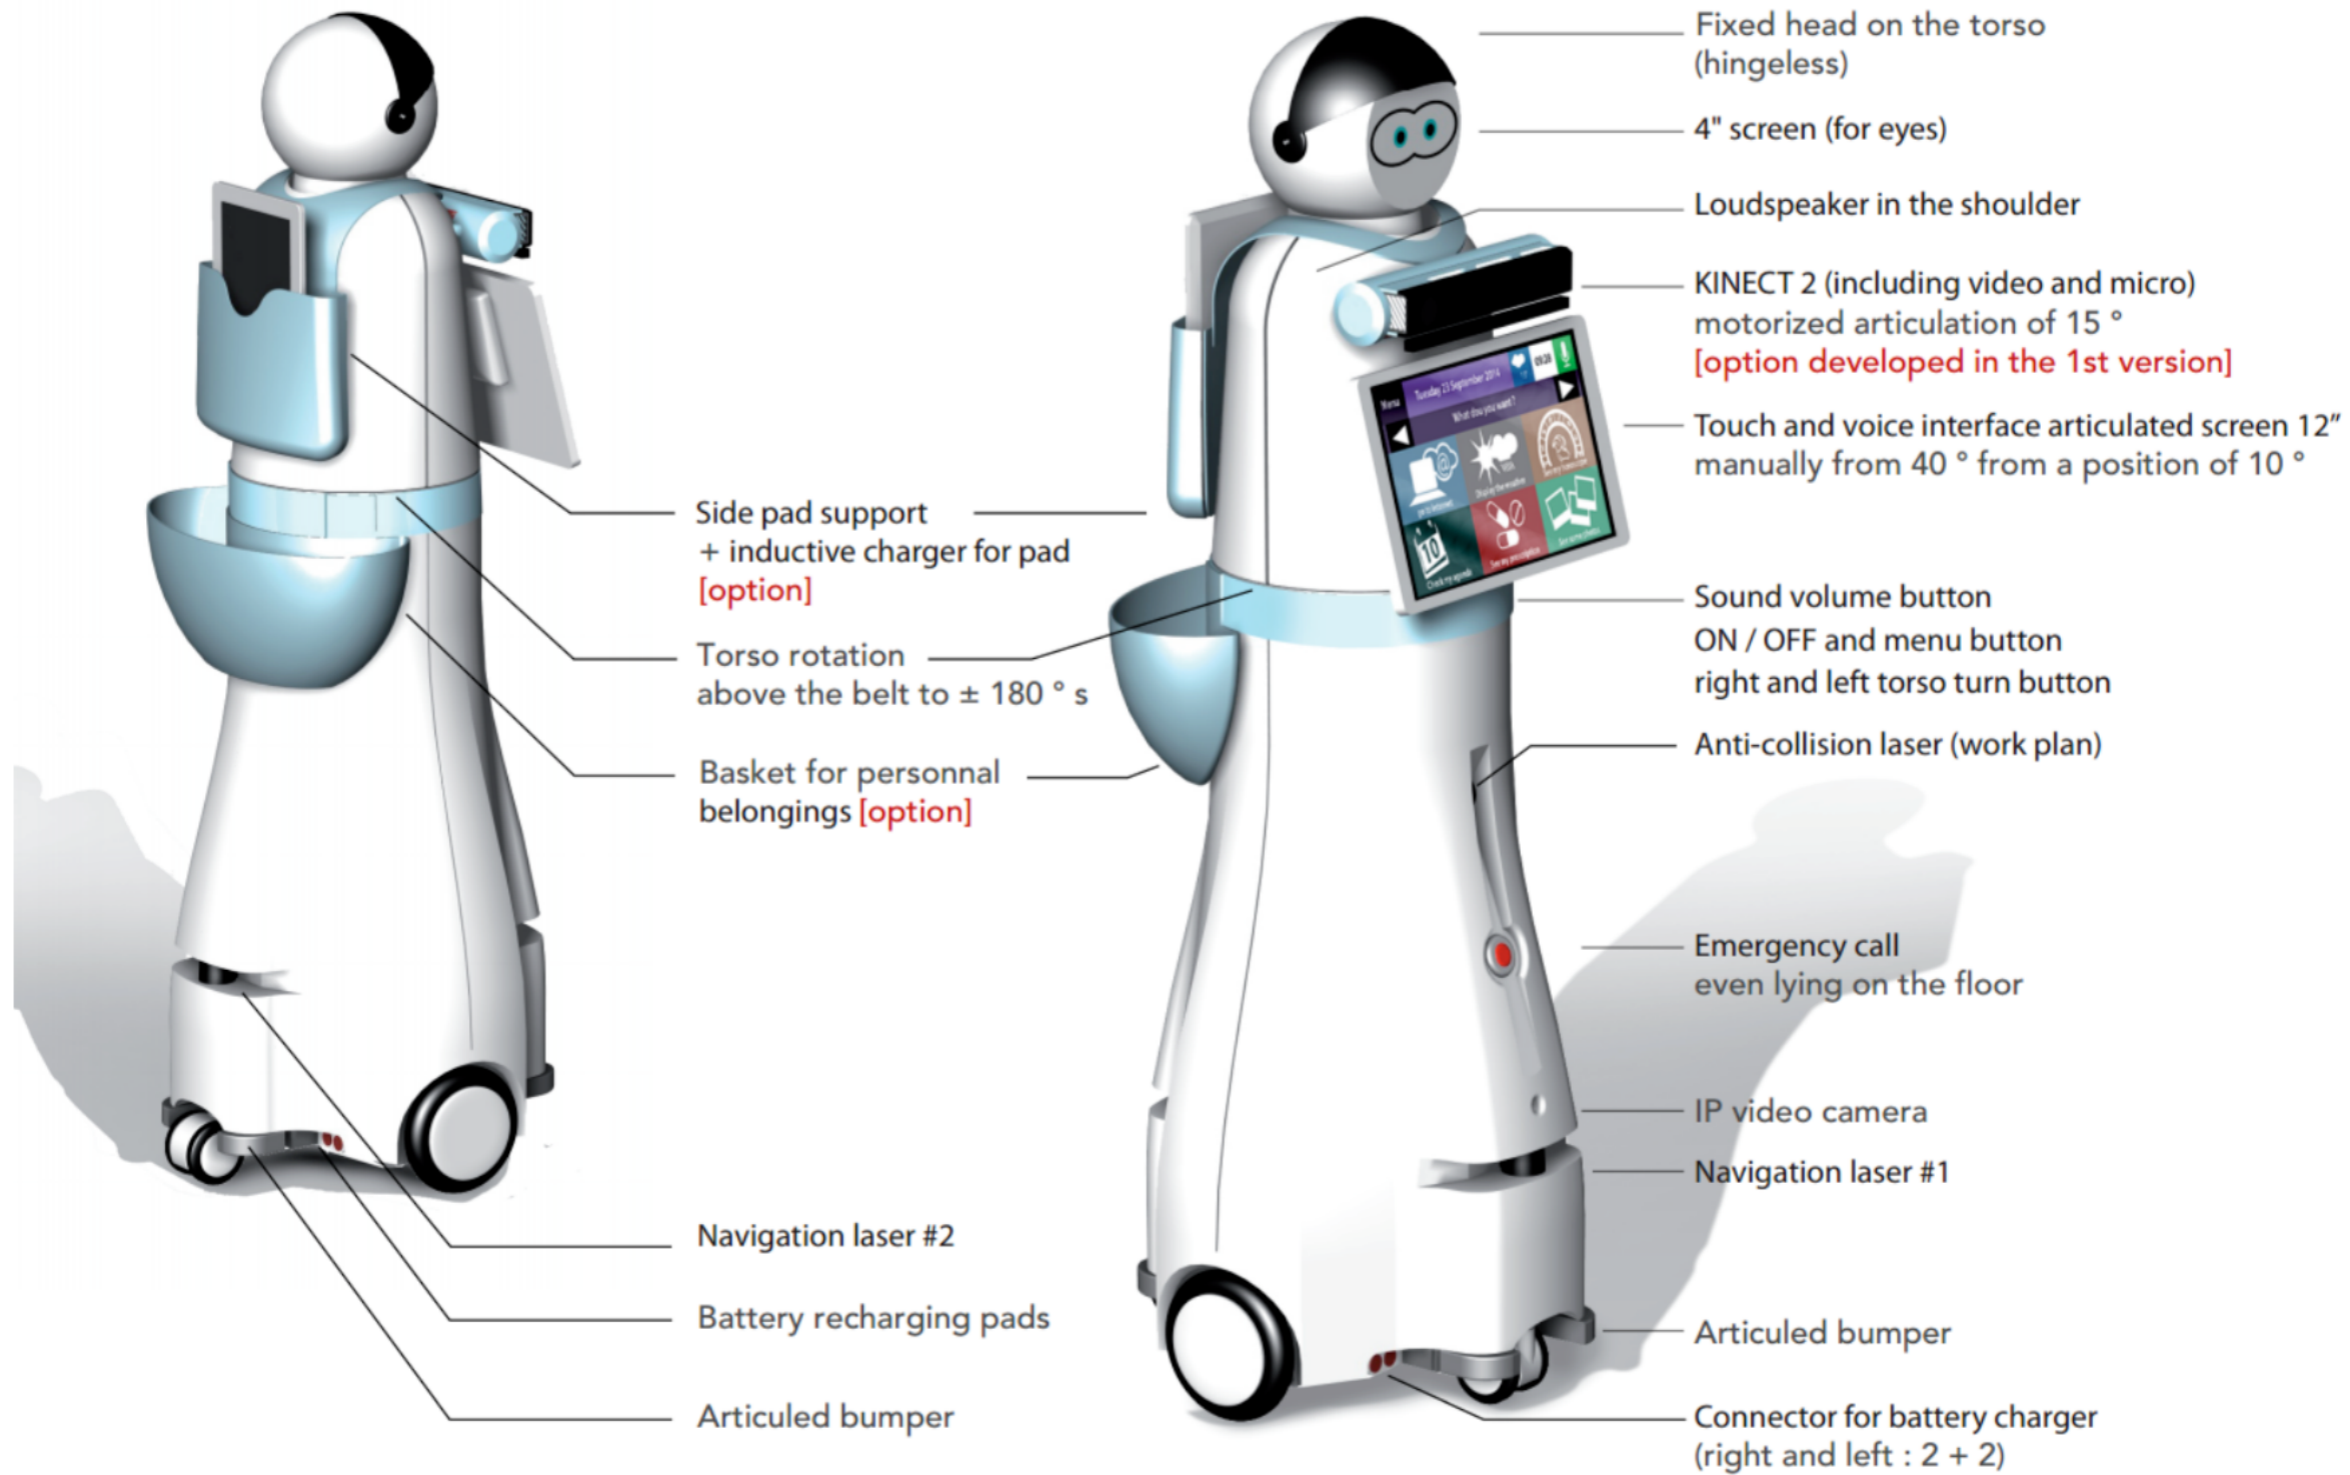

MARIO Project

- Managing Active and healthy aging with use of caRing service robots.
- MARIO is a robot for supporting older people affected by dementia
- It addresses the difficult challenges of loneliness, isolation and dementia in older persons through innovative and multi-faceted inventions delivered by service robots
- Uses Semantic Web and ontologies extensively

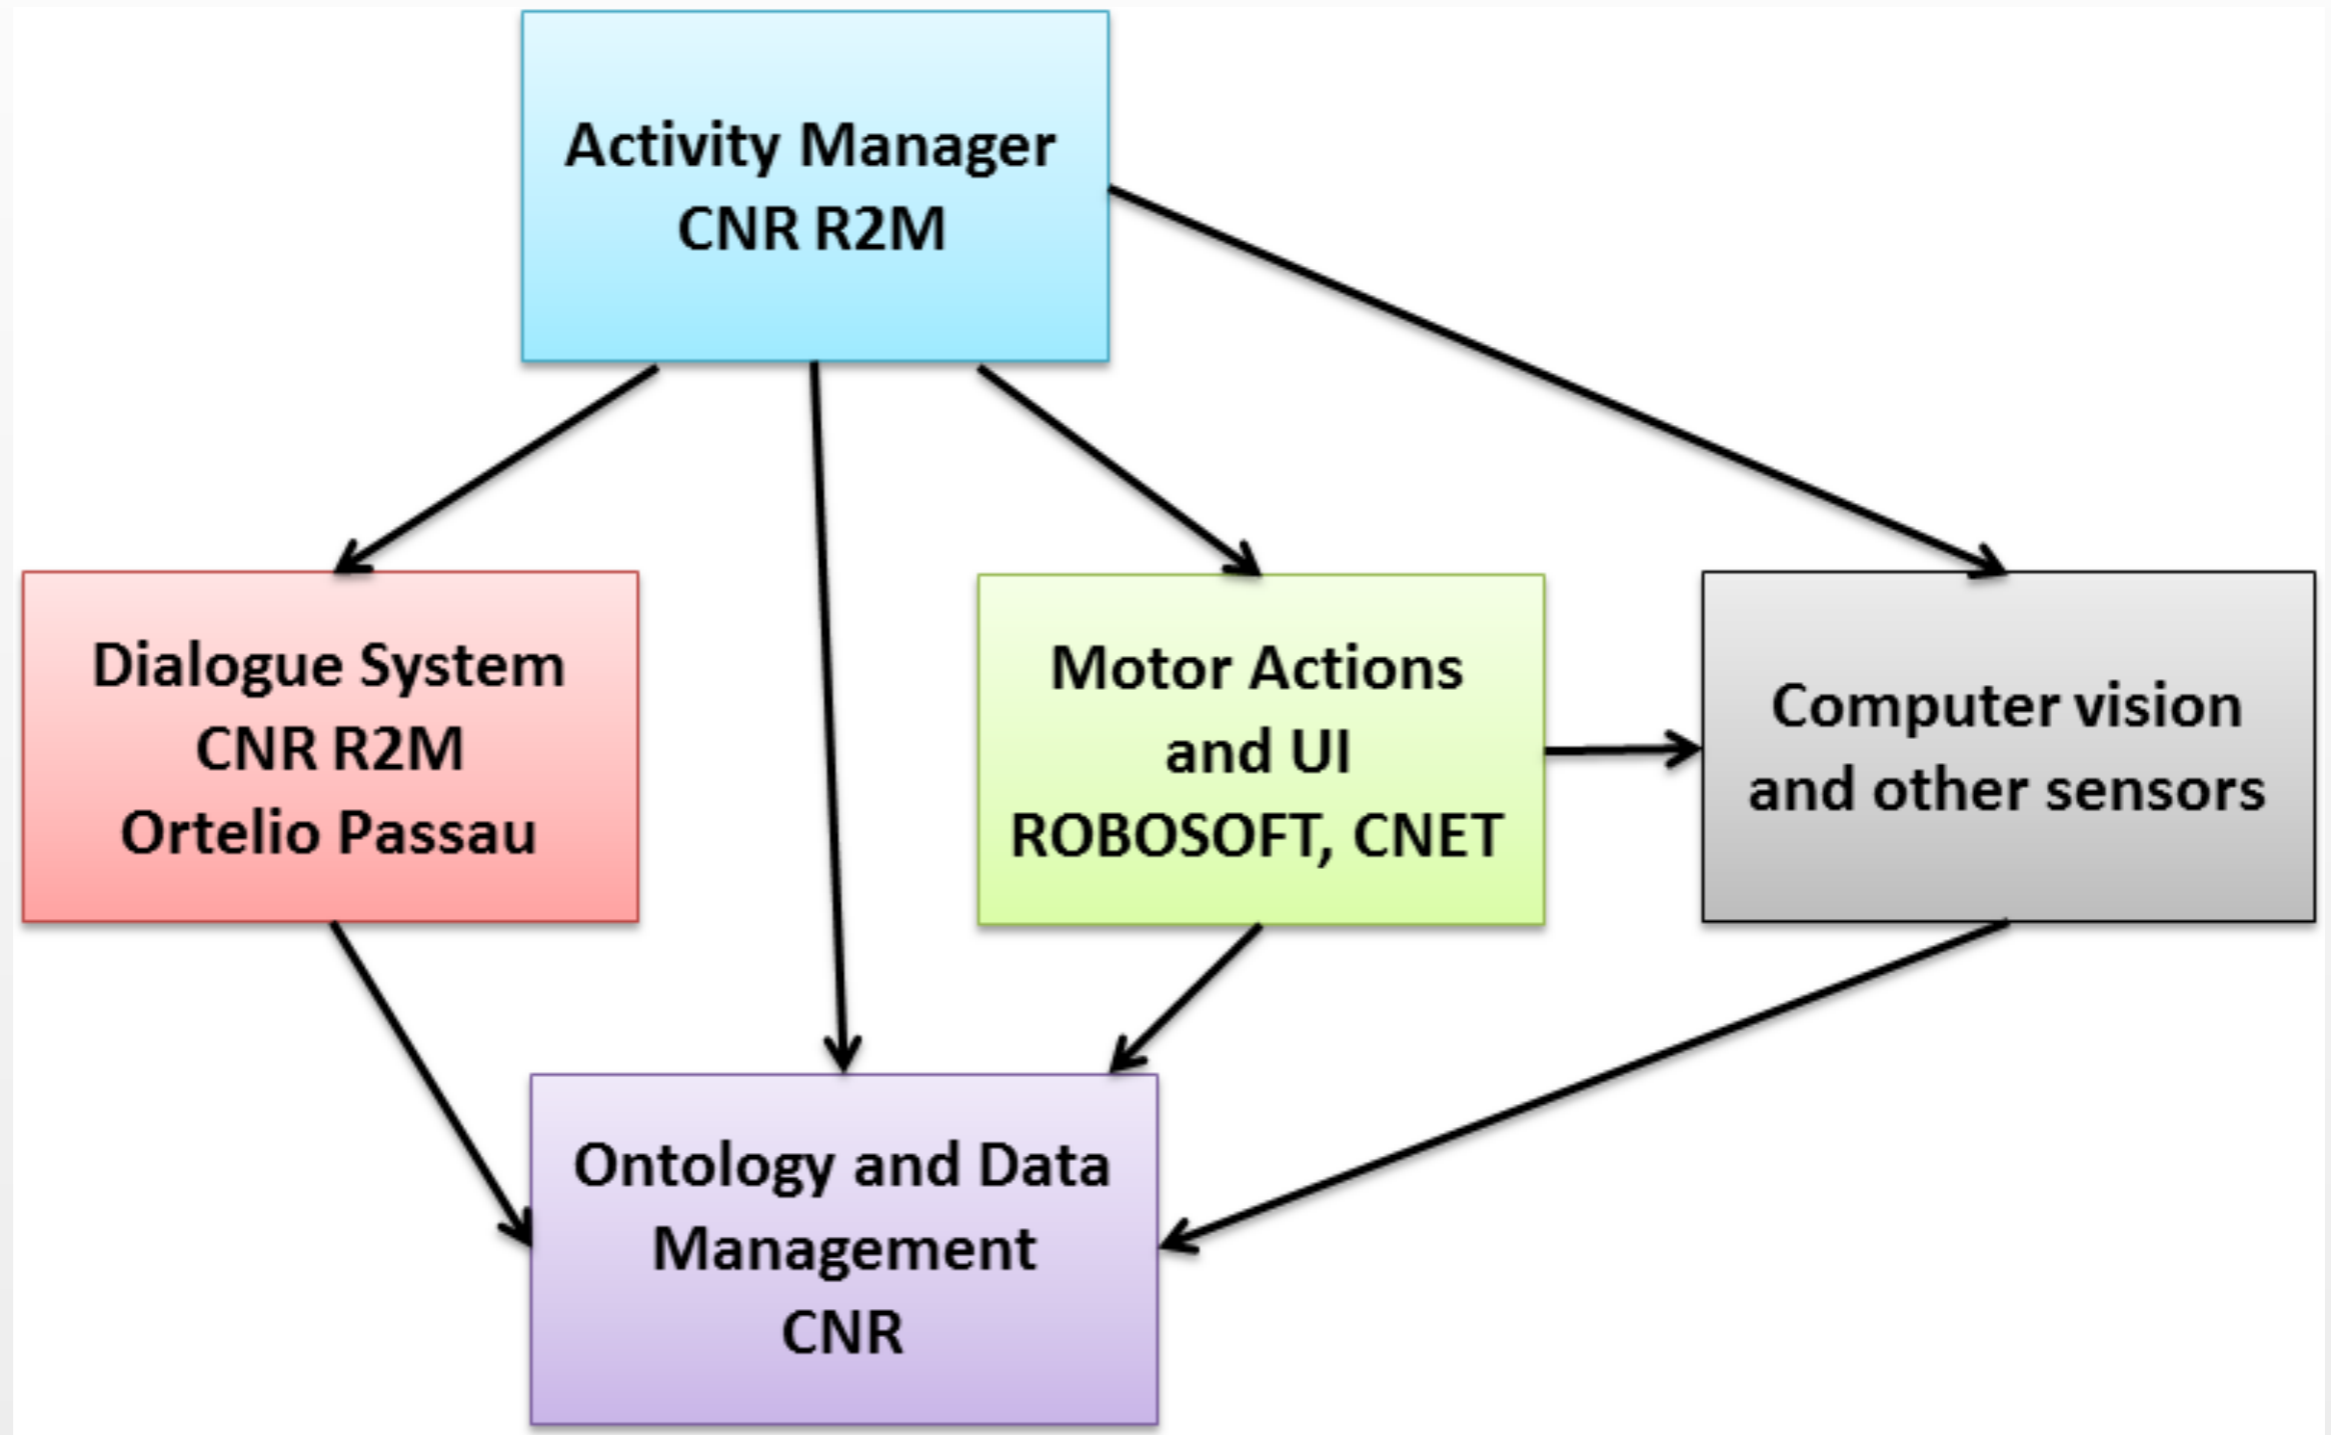

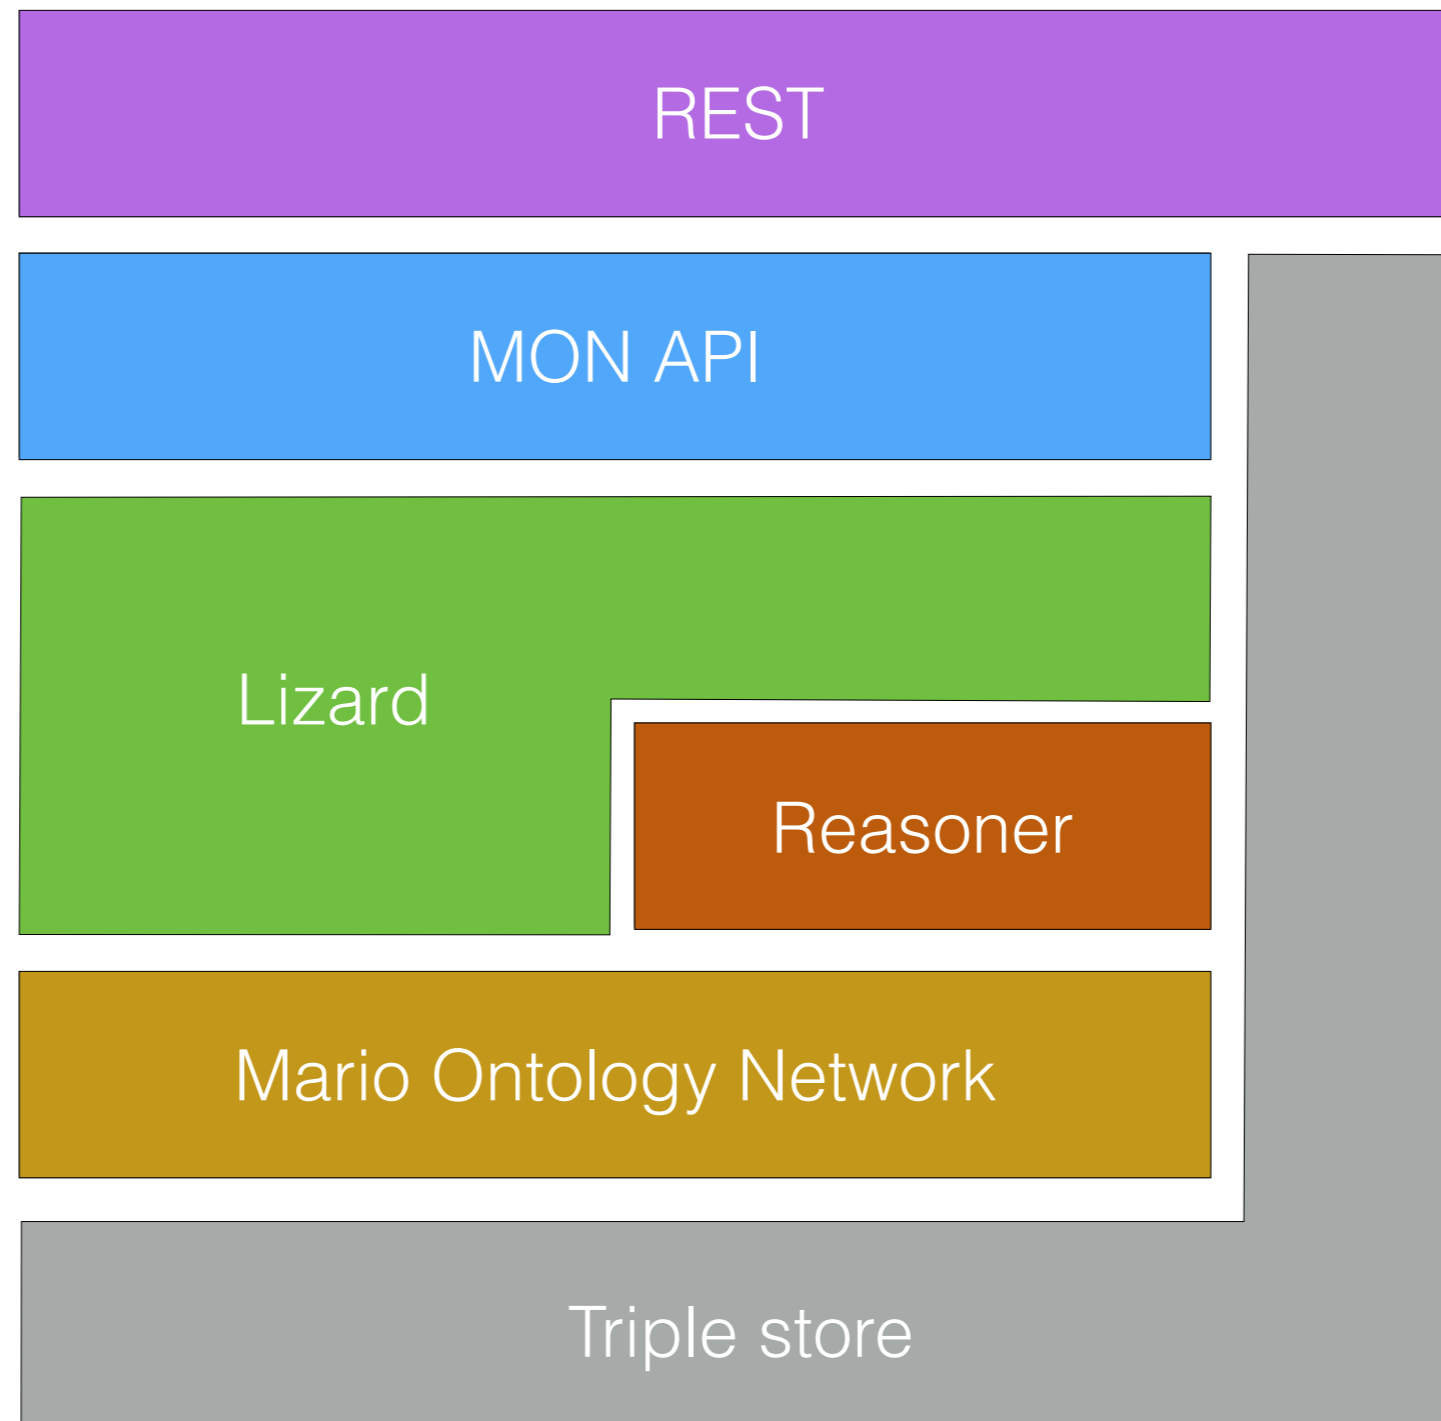

The MARIO robot

MARIO informal architecture

Lizard: Ontology API generator

Ontologies

HTTP REST

Java API

Triplestore

- Lizard is designed and implemented for automatically producing Java and REST API from MON
- Generated API
 - reflect the semantics of MON ontologies
 - enable access via a Knowledge Base modelled with the semantics of MON
- Key features
 - dynamic loading of ontologies to the MARIO Ontology Network (MON)
 - programmatic access to the Knowledge Base of MARIO via Java and HTTP REST
 - transparent access (with respect to client application) to the MON
